DETAILED ACTION

1. This office action is in response to the Request for Continued Examination 8/22/2007. It is noted that claim 1 has been amended and claims 2 and 8 have been cancelled.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1 and 3-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Skinner 4,428,718 in view of Ota 6,629,823.

Skinner discloses a variable displacement compressor comprising: a drive shaft 26 extending along a longitudinal axis, having a first end (end of 26 on right side of Fig. 1) and a second end (end on left side of Fig. 1); a swash plate assembly 50 operatively connected to and driven by said drive shaft; a retainer ring 32 for disposition about said drive shaft, and said drive shaft further having a first annular groove (groove inside 32) between said second end and said swash plate assembly; and a second annular groove (groove that contains spring 107) between said first annular groove and said swash plate assembly; wherein each of said first and second annular groove includes a side that is substantially perpendicular to said longitudinal axis and facing said swash plate assembly (see the left sides of both grooves in Fig. 1). Skinner also discloses that a

.

Art Unit: 3746

conical ramp (see ramp extending from 32) extends out of said first annular groove toward said second annular groove. Skinner discloses that said drive shaft has a variable diameter between said grooves and that each of said first and said second annular grooves includes a bottom and parallel sides (see 26 in Fig. 1). Skinner discloses that one of said sides of said first and second annular grooves extend perpendicularly to said longitudinal axis from said bottom thereof to said variable diameter and the other side of the first annular groove intersects with said conical ramp (see 26 in Fig. 1). Skinner further discloses that said swash plate assembly includes a resilient member 107 disposed annularly about said drive shaft and between said swash plate assembly 50 and said retainer ring to provide a biasing force against said retainer ring (see col. 3, lines 56-61). However, Skinner does not teach that the retainer ring abuts against one of the sides facing the swash plate assembly.

Ota teaches a compressor assembly comprising a drive shaft 8, a retainer ring 16, and a swash plate assembly (see 12). Ota further teaches that the retainer ring resides in a groove (see configuration of 16 in Fig. 1) and abuts against a side of the groove perpendicular to a longitudinal axis of the drive shaft 8, which faces the swash plate assembly (see Fig. 1). Ota further teaches that the swash plate assembly includes a resilient member 15 disposed annularly about said drive shaft 8 and between said swash plate assembly and said retainer ring 16 to provide a biasing force against said retainer ring (see col. 4, lines 38-43).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the drive shaft apparatus of Skinner, by

Application/Control Number: 10/779,884 Page 4

Art Unit: 3746

using the side facing the swash plate assembly in the first annular groove to abut against the retainer ring in order to control the position of the swash plate (Ota, col. 4, lines 38-43).

Response to Arguments

- 4. Applicant's arguments filed 8/2/2007 have been fully considered but they are not persuasive.
- 5. In response to Applicant's arguments in reference to newly amended claim 1:
 Applicant argues that Skinner does not disclose a smooth and continuous conical ramp for facilitating movement of the retainer ring out of the first groove along the shaft.
 Regardless of whether Applicant agrees that Skinner reads on it or not, amended claim 1 does not state that the ramp is "smooth and continuous" as argued. Furthermore, just because the particular ring disposed in the first groove in Skinner is not structured to move, does not mean that the conical ramp in Skinner is not capable of facilitating movement out of the groove. Examiner maintains that the conical ramp in Skinner is indeed capable of facilitating the movement of a retainer ring out of the first groove along the shaft. Therefore, previously cited prior art still reads on the claims.

Conclusion

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Peter J. Bertheaud whose telephone number is (571) 272-3476. The examiner can normally be reached on M-F 9am - 5pm.

Art Unit: 3746

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Anthony Stashick can be reached on (571) 272-4561. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
